of \ favorable \ outcomes \ over Total \ number \ of \ possible \ outcome }\$\$
Direction (1 to 6): Three dice are thrown together. Find the probability of: Q.1.

Dice Problems in Probability for Competitive Exams

Two coins are tossed, find the probability that two heads are obtained.

Bookmark File PDF Dice Probability Problems And Solutions

Note: Each coin has two possible outcomes H (heads) and T (Tails).
Solution The sample space S is given by.
 $S = \{(H,T),(H,H),(T,H),(T,T)\}$ Let E be the event "two heads are obtained". $E = \{(H,H)\}$ We use the formula of the classical probability. $P(E) = n(E) / n(S) = 1 / 4$

Probability Questions with Solutions

A dice has six equally likely outcomes: 1, 2, 3, 4, 5 and 6. The probability of rolling each number is 1 out of 6. We will write the probability of rolling an odd number on a dice as a fraction. The odd numbers are 1, 3 and 5.

Bookmark File PDF Dice Probability Problems And Solutions

Solution: The total number of possible outcomes of rolling a dice once is 6. Hence, the total number of outcomes for rolling a dice twice is $(6 \times 6) = 36$. The probability of getting an odd and even number is 18 and the probability of getting only odd number is 9. i.e., $n(A) = 18$ $n(B) = 9$.
